

In establishing how certain chemicals can cause behavioural disorders, the process of neurotoxicity risk assessment poses significant challenges to every discipline within neuroscience. In this volume, leaders from industrial, academic, and government settings share insights on behavioural measurement in neurotoxicity risk assessment, and address the critical scientific issues arising from the expanding role of neurobehavioral toxicology in public policy development.; The authors set out to provide a comprehensive and authoritative review of current methods in the analysis and interpretation of neurobehavioural toxicology. Coverage begins with a discussion of criteria for determining neurotoxic potential. The next section examines neurobehavioural evaluations in developmental neurotoxicity. Subsequent sections focus on activity and observational data and applications of schedule-controlled operant behaviour in toxicity testing. The contributors address controversies surrounding the suitability and interpretation of procedures designed for neurotoxicological assessments. Some case studies are also included.
